## HOT SPRINGS

### A RUNNING RECORD OF TEMPERATURE

- Use this chart to keep a running record of the temperature of the hot springs.
- Use the extension rod to dip the thermometer into the water of the hot spring. Submerge it into the water for at least two minutes.
- Make sure you stand back at least \_\_\_\_\_ feet; the soil around the springs is typically very slippery and steep, which may lead to fatal accidents.
- To measure the temperature of Double Hot Springs, submerge the thermometer into the runoff from the spring. The spring itself is too dangerous to get close to and has therefore been fenced off.
- **BE CAREFUL** when reading the thermometer-it will be hot after being submerged into the hot spring water!!
- How do the temperatures of the different hot springs compare?
- How does the temperature of one of the hot springs compare to its last recorded temperature? How about the other two springs?

\*\*\*Can we assume temp of double hot dependent on temp of other two springs??

How Hot is it Today?
